

Central cooling system

This system for cooling the moulded items, with a central fan and a filter, reduces the time needed to cool the moulded item. The central fan with a pre-filtration system comes with an air inlet at the floor level, where the air is much cooler than the air above the machine. This fan system produces less noise than centrifugal drum fans do. The cooling system uses directional nozzles with automatic blowing angle adjustment through the operator's touch panel, without having to climb onto the machine to make the necessary adjustments. The cooling system comes with a system for measuring the purity of the filtration system. When the filter needs changing, a message is displayed on the touch panel.
