

## Adjustable Window Frame.

The working window adjustment system enables smooth change and adjustment of the window dimensions, and thus the forming dimensions. The solution consists of four electrically extendable aluminium plates. Smooth, stepless adjustment of the window dimensions is possible in both axes from the control panel. The standard adjustment range for one set of plates is 1000 mm for the X axis and 650 mm for the Y axis. Four electric motors with servo drives are used for adjustment. The plates have a built-in temperature control system. The solution is particularly useful in the case of a wide production range and the necessity of frequent replacement of moulds of various sizes. In combination with an adjustable clamping frame, it provides quick and easy way to change the forming dimensions combined with the possibility of saving settings in the thermoforming machine program.
