

Mobile, divided work table in CNC milling machines.

5-axis CNC milling machines of the SMARTCUT series can be equipped with special, mobile work tables, which facilitate the work and operation of the machine. The mobility of the table relies on the possibility of its drive, in whole or in part, outside the machine by means of servo drives. Thanks to this, you can more conveniently and efficiently replace or fasten elements on the table top.

In addition, the work table can be divided into two independent parts, enabling work alternately with the replacement of elements. Table tops can have a grooved or hybrid surface, allowing for vacuum fixing of the processed materials. If necessary, both parts of the table can be integrated into one common worktop.
